

JACS VALIDATION

(step by step)

Step 1:

Define your focus, what do you seek to validate?

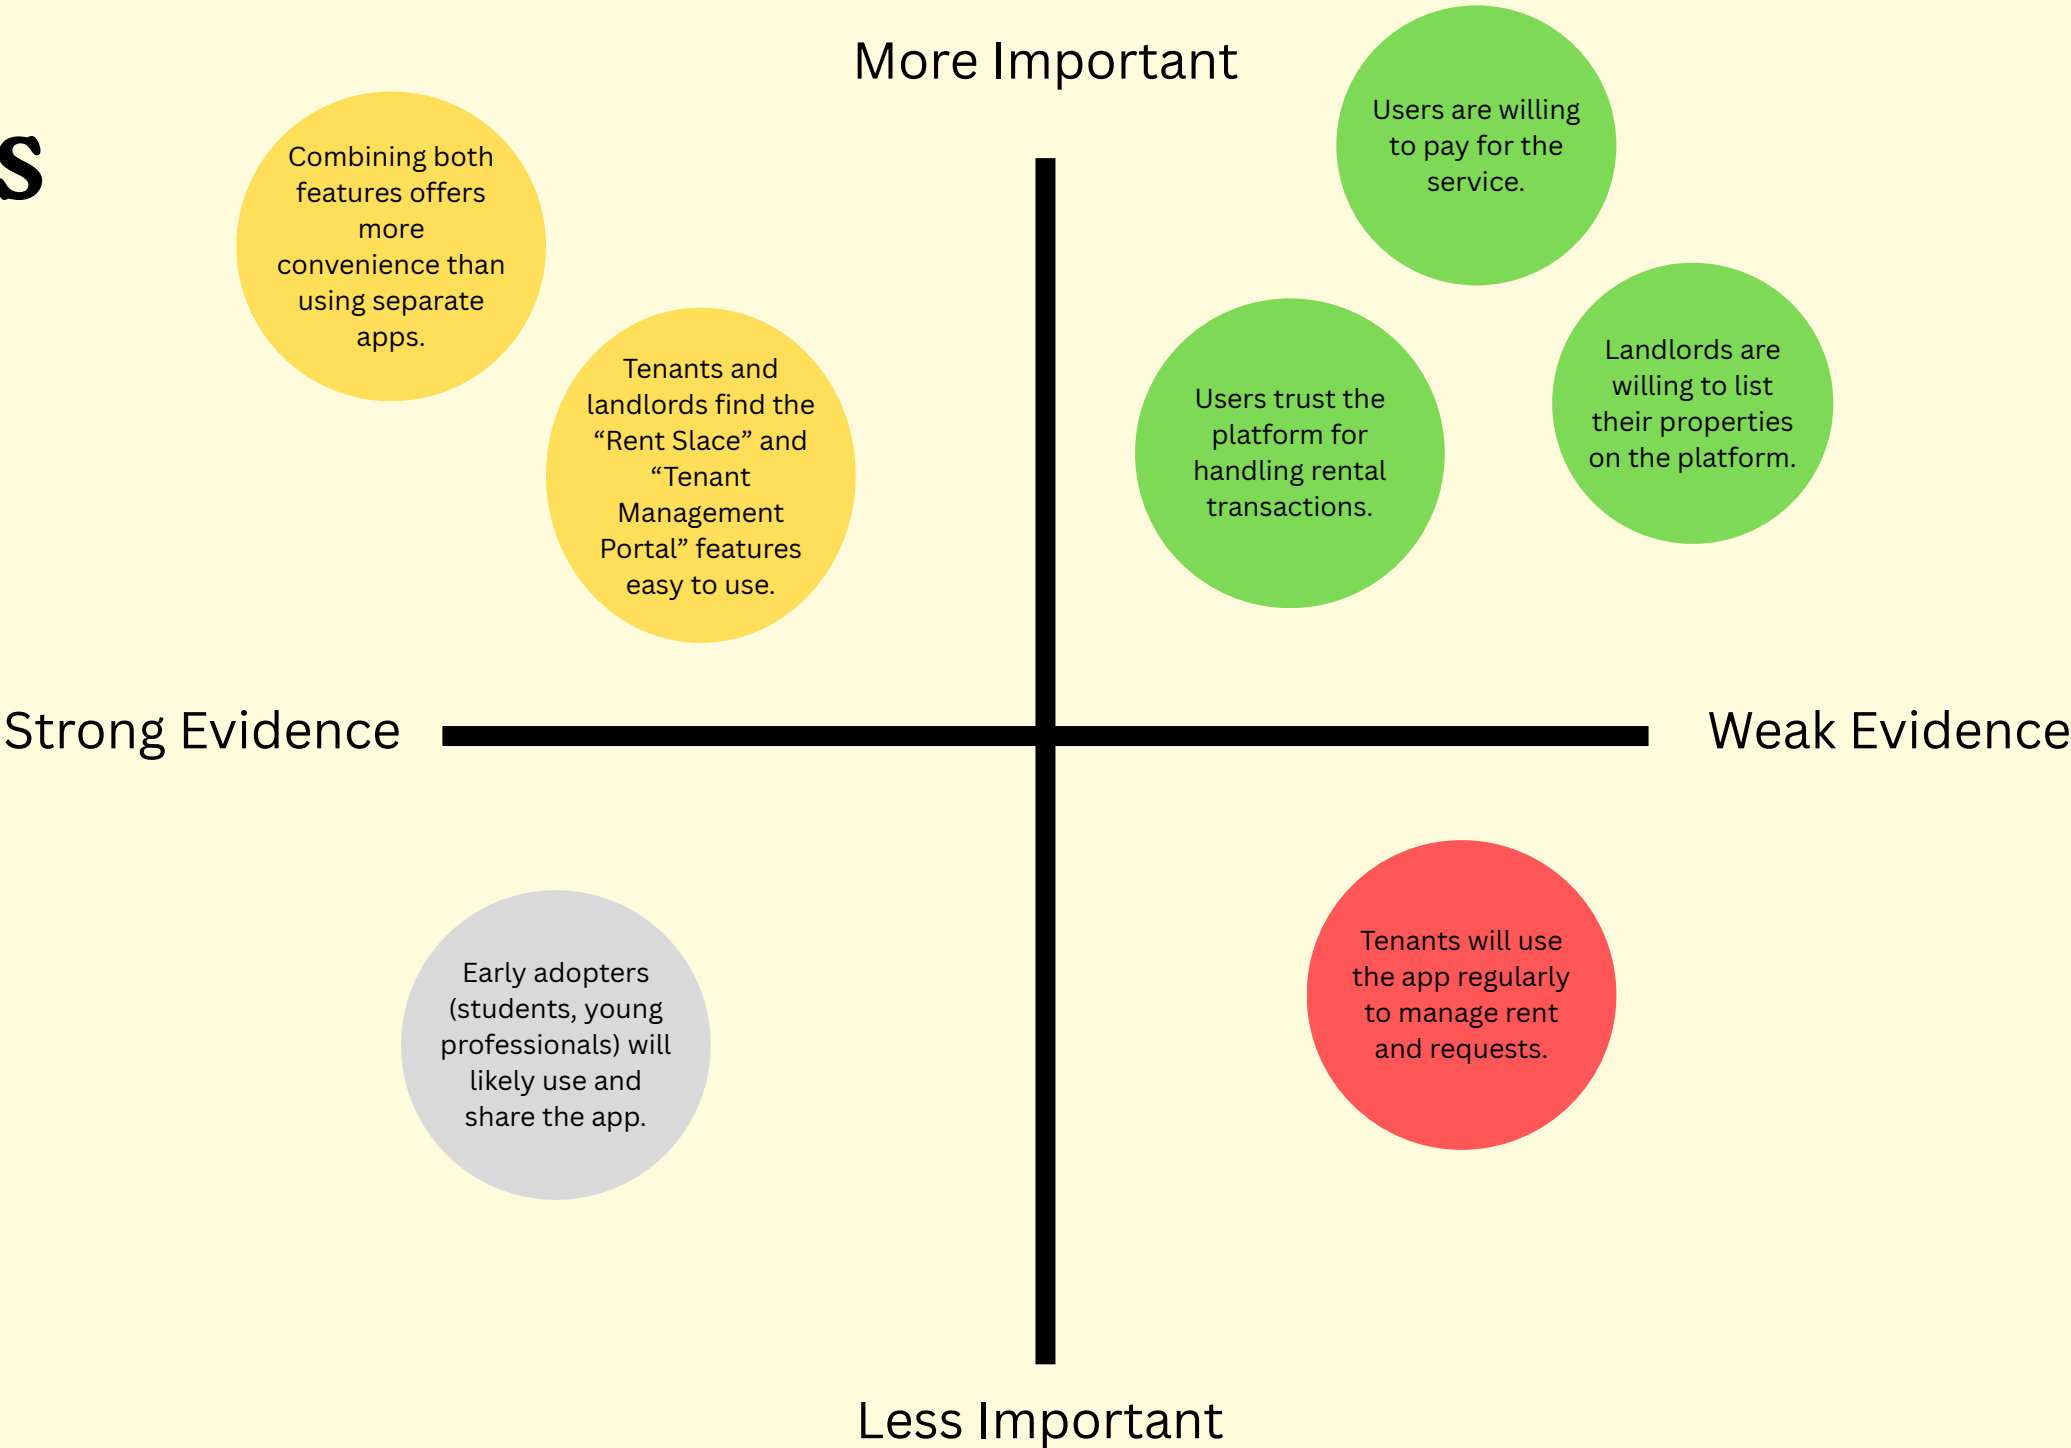

The goal of our validation is to confirm that our rental management system's core features “**Rent Space**” and “**Tenant Management Portal**” are effective, user-friendly, and aligned with user expectations in real rental scenarios. While users have shown interest in using an all-in-one rental management platform, our main challenge is determining how effective our current solution is in addressing their needs and how we can price it appropriately to ensure it fits the market. We are currently in the Product Validation stage, as the system is already functional but still under development and has not yet been tested with real users in actual usage conditions. Through this validation, we aim to assess the system's usability, performance, and overall value to both tenants and landlords, as well as explore a suitable pricing strategy that balances user affordability and business sustainability.

Step 2:

Map Out Your Assumptions

Assumptions:

Users trust the platform for handling rental transactions.
Users are willing to pay for the service.
Landlords are willing to list their properties on the platform.
Tenants and landlords find the “Rent Slace” and “Tenant Management Portal” features easy to use.
Combining both features offers more convenience than using separate apps.
Tenants will use the app regularly to manage rent and requests.
Early adopters (students, young professionals) will likely use and share the app.

This assumption map helps us identify which beliefs to test first especially those with high importance and weak evidence.

Step 3:

Choose and Design the Relevant Experiments

Experiment	Hypothesis	Method	How to Test	Success Metric
1. User Trust Validation	Users trust the platform for handling rental transactions.	Conduct a user trust and safety survey.	Ask potential users if they feel comfortable sharing payment and personal information through the platform.	70% or more indicate trust in using the platform.
2. Willingness to Pay Test	Users are willing to pay for the service.	Pricing survey or landing page with subscription options.	Present multiple pricing tiers and see which options get the most interest or sign-ups.	60% or more express willingness to pay or select a paid plan.
3. Landlord Participation Test	Landlords are willing to list their properties on the platform.	Prototype testing with landlords.	Invite 10 landlords to create and publish property listings in the demo app.	6 out of 10 landlords successfully list properties and express satisfaction.
4. Usability Test for Core Features	Tenants and landlords find the “Rent Space” and “Tenant Management Portal” features easy to use.	Conduct usability testing sessions.	Observe participants performing key tasks (posting, paying, managing rentals).	80% of users complete tasks without help.
5. Feature Convenience Comparison	Combining both features offers more convenience than using separate apps.	Comparative interview or survey.	Ask users to compare task completion using two separate apps vs. the combined prototype.	70% or more prefer the combined version.
6. Tenant Engagement Test	Tenants will use the app regularly to manage rent and requests.	Build a functional prototype and track activity.	Measure user engagement over one week of simulated use.	75% of testers return to the app at least twice.
7. Early Adopter Validation	Early adopters (students, young professionals) will likely use and share the app.	Run a social media campaign and track engagement.	Share an explainer video or signup form in student and professional groups.	At least 50 sign-ups or 10% share rate among viewers.
